

# Implementation of Conventional and Neural Controllers Using Position and Velocity Feedback

---

## **Progress Report 1**

**By:**

Chris Spevacek and Manfred Meissner

**Advisor:**

Dr. Gary Dempsey

# Summary

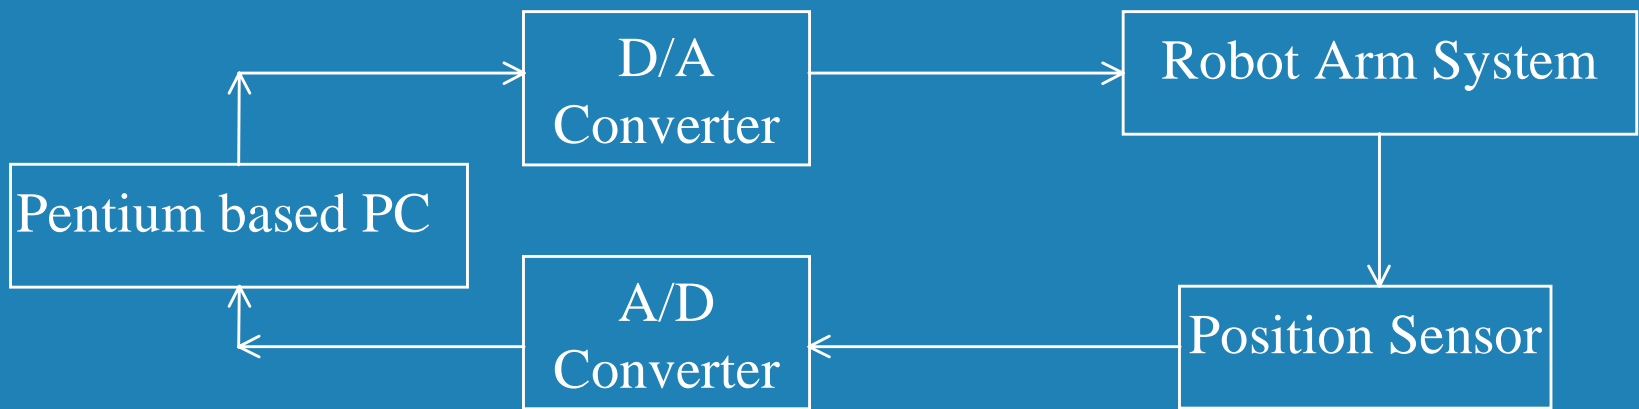

---

Design and Compare Conventional and Neural Controllers for  
a Small Robot Arm

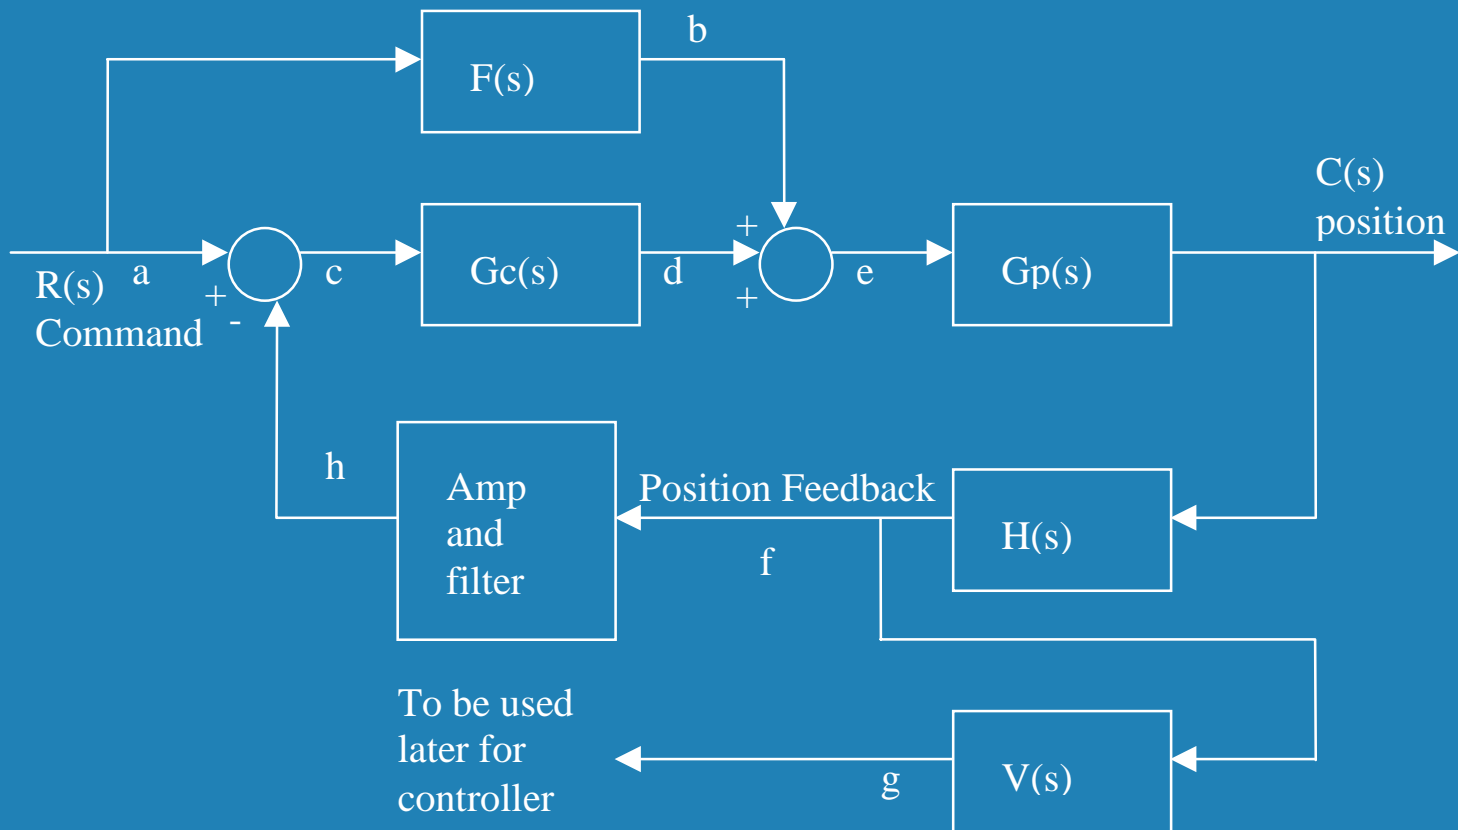

Position and Velocity Feedback Design

User Friendly Interface Design

# High Level Block Diagram

# Control Block Diagram

# Progress

---

\* System Identification

\* Help Menu

# System Identification

---

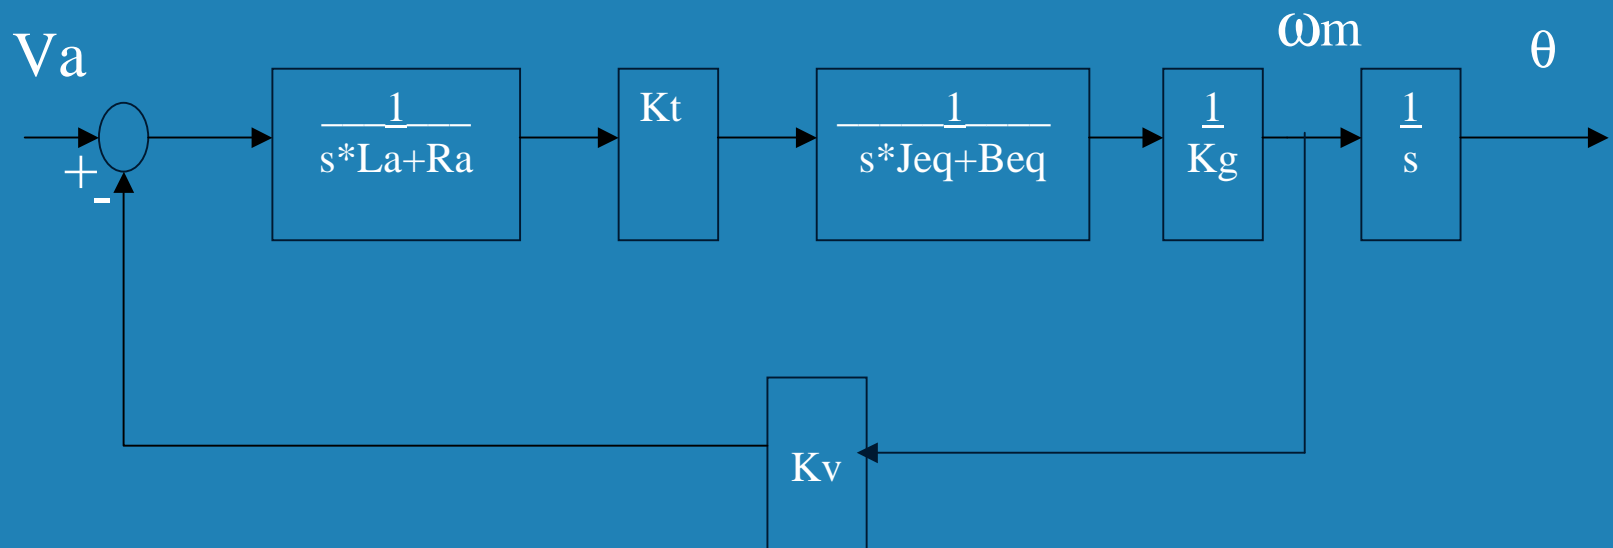

## System

- \* Level arm with light load

## Objective:

- \* Find System Model from Theory
- \* Derive S-Plane
- \* Find Plant Model

# Robot Arm System Block Diagram

$R_a=2.6\text{Ohms}$   $L_a = 0.18\text{mH}$  Gives a pole at 340Hz

$K_t=0.00767\text{Nm/amp}$   $K_v=0.00767\text{V/rad/sec}$   $K_g = 1/70$

Power Amp pole at 60kHz

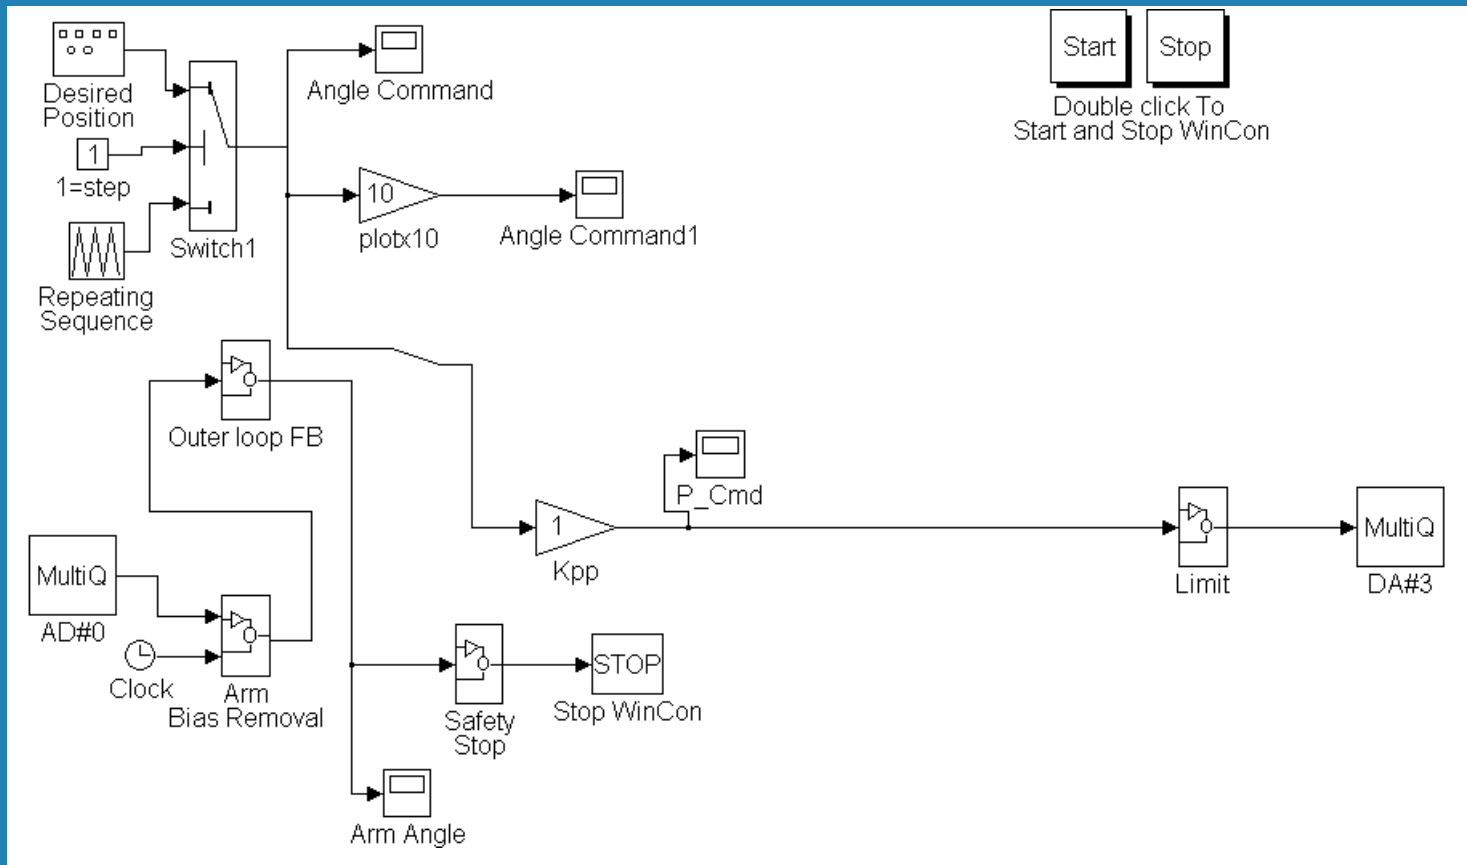

# S-Plane of System

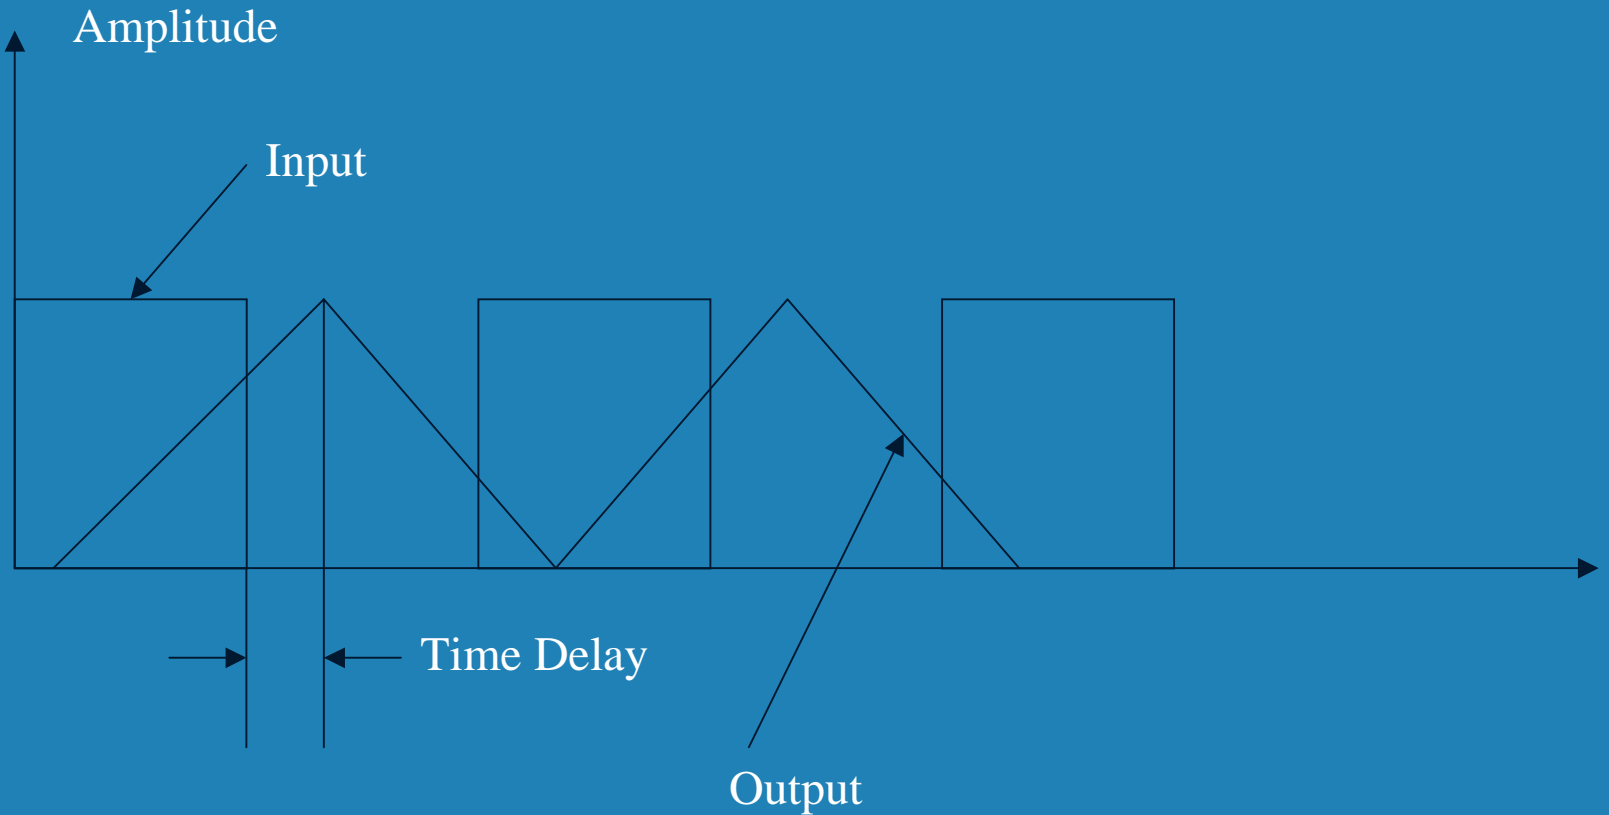

Integrator

# Open Loop WinCon

# Time Delay Measurement

# Time Delay

---

- \* 25ms counterclockwise
- \* 15ms clockwise
- \* Design worst case

# Second Pole Search

- ✧ At 2nd pole phase lag should be  $135^\circ$
- ✧  $135^\circ = -90^\circ - \arctan(\omega/\text{pole}) - (\omega * T_d * 180/\pi)$

# Problem

---

- \*  $T_d$  too big
- \*  $\omega * T_s * 180 / \pi$  term = 45 degree  
 $135^\circ = -90^\circ - \arctan(\omega / \text{pole}) - (\omega * T_d * 180 / \pi)$
- \* Pole not verified

# K value

# Conclusion

---

$$Gp = \frac{K e^{-std}}{s}$$

With  $K=V_{out}/V_{in}=0.977$   
and  $td=25ms$

# Verifying Result

- \* Using Simulink to simulate plant
- \* %Overshoot of experiment did not agree with simulation
- \* Switch to 2nd order system

$$Gp = \frac{K e^{-std}}{s(s / p + 1)}$$

# Measurement

Gain $k$	1	0.8	0.333	0.2
% Overshoot	44%	41%	10%	0%

# Approaches

---

- ✧ MatLab match
  - 2 unknowns pole and K
  - try to match
- ✧ Experimental finding gain K
  - use MatLab to match up pole

# Velocity Approach

- \* Time revolutions at different voltages
- \* Divide velocity by input voltages
- \* Adjust to average K
- \* MatLab to match pole

Voltage	Time/Revolution	Gain
4 Volts	12.5 sec	7.2
3 Volts	12.8 sec	9.375
2 Volts	13.0 sec	13.84

# Results

Matlab Match

$$Gp = \frac{6.9 * e^{-s*0.025}}{s(s / 3.2 + 1)}$$

K Measurement

$$Gp = \frac{10.1 * e^{-s*0.025}}{s(s / 2 + 1)}$$

Gain k	1	0.75	0.33	0.2
% Overshoot Experiment	44%	41%	10%	0%
% Overshoot Matlab	44%	36%	13%	3%
% Overshoot K-Measurement	43%	35%	15%	5%

# Help Menu

---

- \* Some commands are not verified on main screen
- \* Needed extra space
- \* Command line added to real time plots

# Main Screen

The screenshot shows a DOS-style window titled 'screen1'. The window has a menu bar with 'Auto' and a dropdown arrow, and a toolbar with icons for window management and a keyboard shortcut 'A'. The main content area is a text-based interface with two columns of data and a list of control options.

```
MS-DOS screen1
Auto
REAL TIME DATA
REAL TIME(sec) 104.5
FEEDBACK(U) -0.0
ANGLE -0.04
CMD 0.00

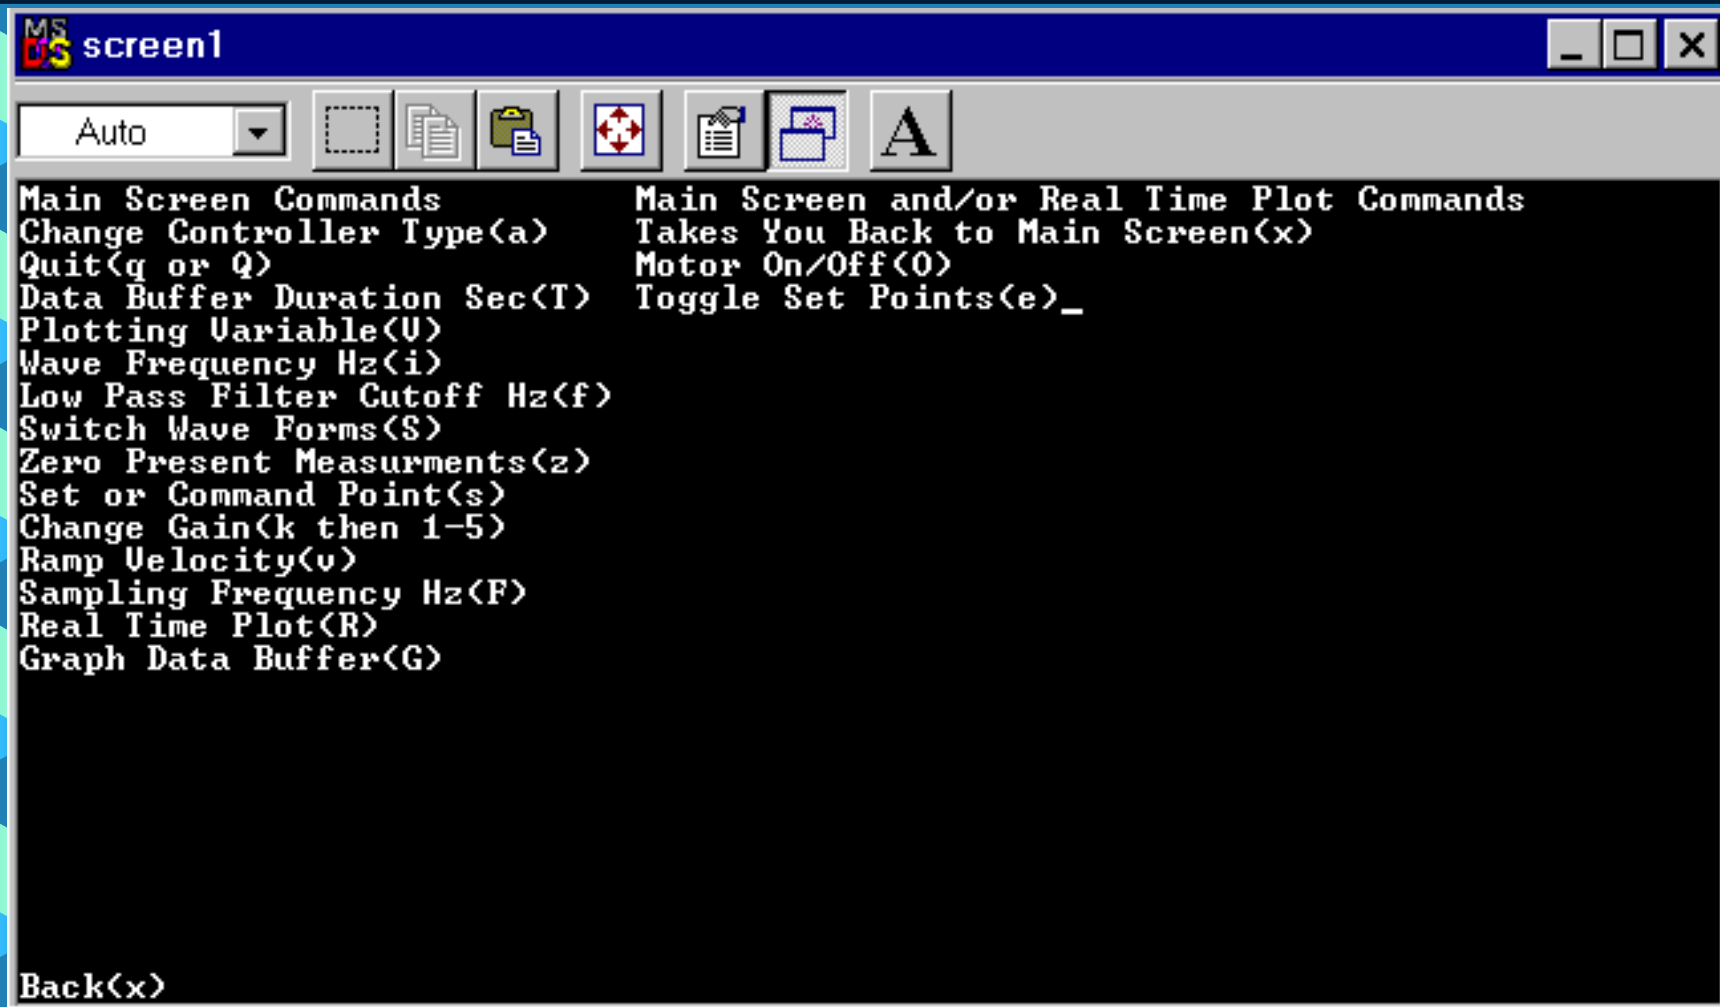

SELECT ONE OF THE FOLLOWING:
[O]: Motor off OFF
[k1]: Gain k1 0.1000
[k2]: Gain k2 0.0010
[k3]: Gain k3 0.0000
[k4]: Gain k4 0.0000
[k5]: Gain k5 0.0000

[s]: Command set point 0.00
[v]: Ramp velocity 100.00
[F]: Sampling Frequency(Hz) 200.00
[T]: Data buffer duration(Sec) 3.0
[f]: Lowpass filter cutoff(Hz) 20.0
[l]: Input Step/Ramp frequency(Hz) 0.50
[V]: Plotting variable Angle
[G]: Graph the data buffer / Save on Disk
[R]: Realtime plot
[Q]: Quit program

[5] SET POINT TYPE
[r] ALTERNATING STEP
[a] FIXED CONTROLLER
  [1/2] TYPE:
  1 P -

HELP(H)
```

# Help Screen

The screenshot shows a window titled "screen1" with a standard Windows-style title bar (minimize, maximize, close buttons). Below the title bar is a toolbar with a dropdown menu set to "Auto" and several icons: a dashed box, a document with a pencil, a folder with a document, a four-way arrow, a document with a magnifying glass, a document with a plus sign, and a large letter "A". The main content area is a black background with white text, organized into two columns of commands. The left column is titled "Main Screen Commands" and the right column is titled "Main Screen and/or Real Time Plot Commands".

Main Screen Commands	Main Screen and/or Real Time Plot Commands
Change Controller Type(a)	Takes You Back to Main Screen(x)
Quit(q or Q)	Motor On/Off(O)
Data Buffer Duration Sec(T)	Toggle Set Points(e)_
Plotting Variable(U)	
Wave Frequency Hz(i)	
Low Pass Filter Cutoff Hz(f)	
Switch Wave Forms(S)	
Zero Present Measurements(z)	
Set or Command Point(s)	
Change Gain(k then 1-5)	
Ramp Velocity(v)	
Sampling Frequency Hz(F)	
Real Time Plot(R)	
Graph Data Buffer(G)	

Back(x)
